Do Now:
In Lewis Carroll’s *Through the Looking Glass*, Tweedledum says, “The sum of your weight and twice mine is 361 pounds.” Tweedledee replies, “The sum of your weight and twice mine is 362 pounds.” Find both of their weights.

Classwork:
1. Lulu tells her little brother, Jack, that she is holding 20 coins all of which are dimes and quarters. They have a value of $4.10. She says she will give him the coins if he can tell her how many of each she is holding. Solve this problem for Jack.

2. At a state fair, there is a game where you throw a ball at a pyramid of cans. If you knock over all of the cans, you win a prize. The cost is 3 throws for $1, but if you have an armband, you get 6 throws for $1. The armband costs $10.
   - a. Write two cost equations for the game in terms of the number of throws purchased – one without an armband and one with.
   
   b. Graph the two cost equations on the same graph. Be sure to label the axes and show an appropriate scale.
   
   c. Does it make sense to buy the armband?
3. A clothing manufacturer has 1000 yd. of cotton to make shirts and pajamas. A shirt requires 1 yd. of fabric and a pair of pajamas requires 2 yd. of fabric. It takes 2 hr. to make a shirt and 3 hr. to make the pajamas, and there are 1600 hr. available to make the clothing.
   a. What are the variables?
   
   b. What are the constraints?
   
   c. Write inequalities for the constraints.
   
   d. Graph the inequalities and shade the solution set.
   
   e. What does the shaded region represent?
   
   f. Suppose he makes a profit of $10 on shirts and $18 on pajamas. How would he decide how many of each to make?
   
   g. How many of each should he make, assuming he will sell all the shirts and pajamas he makes?
Problem Set

1. Find two numbers such that the sum of the first and three times the second is 5 and the sum of second and two times the first is 8.

2. A chemist has two solutions: a 50% methane solution and an 80% methane solution. He wants 100 ml of a 70% methane solution. How many ml of each solution does he need to mix?

3. Pam has two part time jobs. At one job, she works as a cashier and makes $8 per hour. At the second job, she works as a tutor and makes $12 per hour. One week she worked 30 hours and made $268. How many hours did she spend at each job?

4. A store sells Brazilian coffee for $10 per lb. and Columbian coffee for $14 per lb. If they decide to make a 150-lb. blend of the two and sell it for $11 per lb., how much of each type of coffee should be used?
A potter is making cups and plates. It takes her 6 min. to make a cup and 3 min. to make a plate. Each cup uses \( \frac{3}{4} \) lb. of clay and each plate uses 1 lb. of clay. She has 20 hr. available to make the cups and plates and has 250 lb. of clay.

What are the variables?

b. Write inequalities for the constraints.

c. Graph and shade the solution set.

d. If she makes a profit of $2 on each cup and $1.50 on each plate, how many of each should she make in order to maximize her profit?

e. What is her maximum profit?
Exit Ticket

1. Andy’s Cab Service charges a $6 fee plus $0.50 per mile. His twin brother Randy starts a rival business where he charges $0.80 per mile, but does not charge a fee.

   a. Write a cost equation for each cab service in terms of the number of miles.

   b. Graph both cost equations.

   c. For what trip distances should a customer use Andy’s Cab Service? For what trip distances should a customer use Randy’s Cab Service? Justify your answer algebraically and show the location of the solution on the graph.
